A student's score is best interpreted when recognizing that the student's knowledge and skills fall within a score range and not just a precise number. For example, 2300 (+/-10) indicates a score range between 2290 and 2310.

There is some uncertainty in all test scores. If these students took the test multiple times, their average score would lie within the range indicated next to the average scale score 65% of the time.

Information on Standard Error of Measurement

A student's score is best interpreted when recognizing that the student's knowledge and skills fall within a score range and not just a precise number. For example, 500 (+/-30) indicates a score range between 470 and 530.

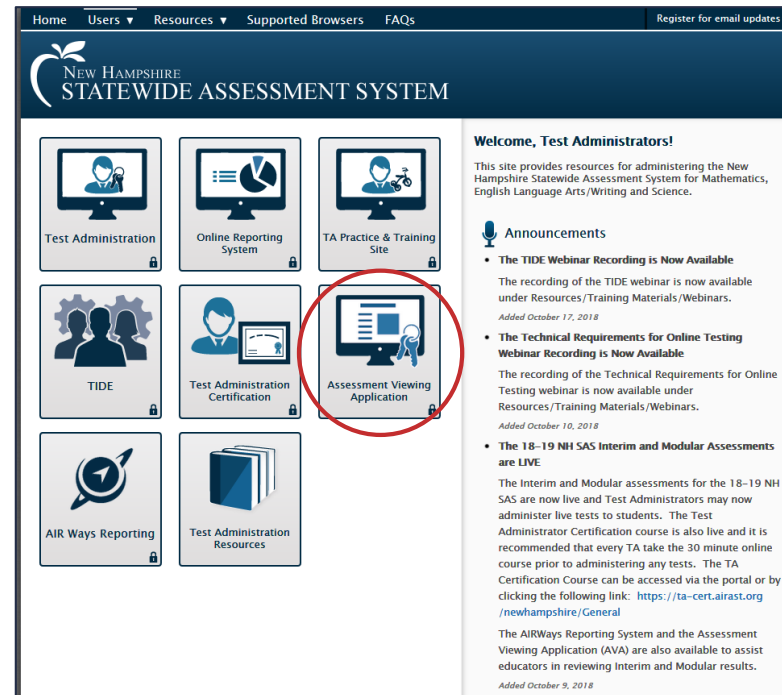

The table and the graph below indicate student performance on individual reporting category. The black line indicates the student's score on each reporting category. The green rectangle shows the range of likely scores your student would receive if he or she took the test multiple times.
